Camunda 8

Connectors Overview

What will I learn?

- Describe Connectors and how they can accelerate process automation projects
- Differentiate between Connector types
- Explore Camunda Marketplace
- Use the REST Outbound Connector in a process
- Use the SendGrid Outbound Connector in a process
- Configure and use Secrets

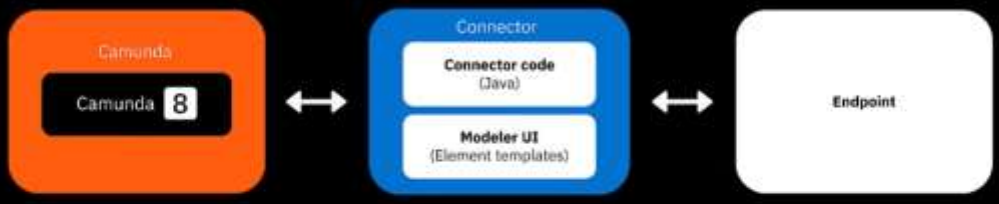
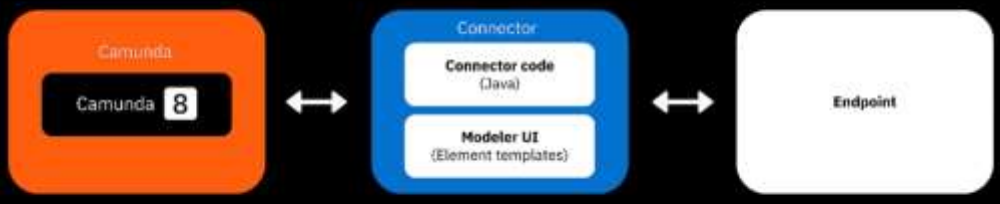
Connectors

Introduction to Connectors



Introduction to Connectors



All Connectors are available in Camunda 8 SaaS and Self-Managed

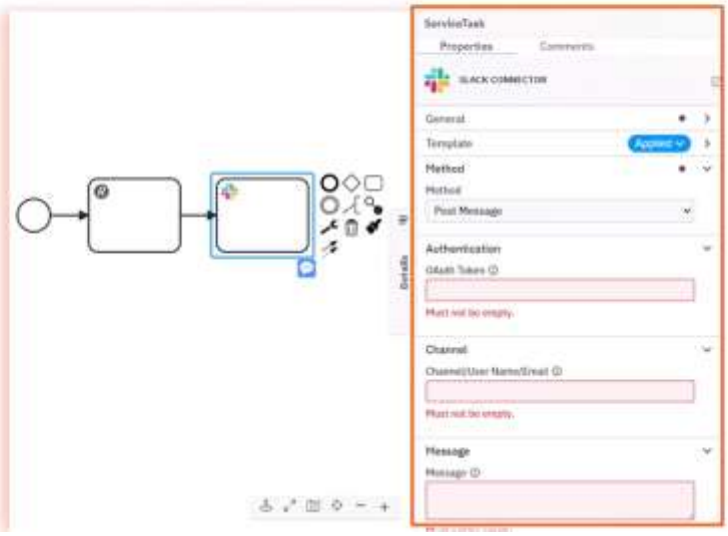
What are Connectors?

Reusable building blocks that enable connectivity to external systems

Connectors are represented by a concrete task in a BPMN process in Camunda Modeler

What are Connectors?

Connectors can be configured in an intuitive properties panel without the need for code.

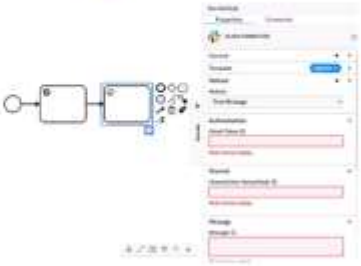


What are Connectors?

Reusable building blocks that enable connectivity to external systems

Connectors are represented by a concrete task in a BPMN process in Camunda Modeler

Connectors can be configured in an intuitive properties panel without the need for code.



The components of a Connector are:

1. The programming code in Java to connect to the external system (Connector function)
2. The user interface to be used during modeling, which is provided using Connector Templates

Camunda 8 provides a variety of out of the box Connectors

Connectors are a great tool to reduce the time and effort required to develop process automation solutions.

Types of Connectors

Inbound

Allows a Process Instance to be started or influenced by an external system or service

It triggers process automatically

It can be a Message Catch Event or a Receive Task

Outbound

Allows a Process Instance to issue a request to an external system or service.

Allows the Process Instance to invoke business logic managed outside of Camunda.

It can be a Message Throw event or a Service Task

Types of Connectors

Inbound

Allows a Process Instance to be started or influenced by an external system or service

It triggers process automatically

It can be a Message Catch Event or a Receive Task

Outbound

Allows a Process Instance to issue a request to an external system or service.

Allows the Process Instance to invoke business logic managed outside of Camunda.

It can be a Message Throw event or a Service Task

Types of Connectors

Protocol Connectors

Can be used as either inbound or outbound Connectors, supporting a variety of technical protocols.

Highly generic, designed to provide a flexible and customizable means of integration with external systems and services.

Examples include HTTP Webhook, REST, GraphQL Connectors, as well as message queue connectors.

Connectors

Benefits

Benefits

Time to value

Out of the box Connectors in addition to a flexible Integration Framework simplify the deployment of process automation solutions.

Connectors allow for fast and simple connectivity with multiple applications.

Developers can create custom Connectors which can be used to integrate with custom applications. Anyone using the Modeler can easily find both out-of-the-box and custom Connectors and configure them for use in their business processes.

Benefits

Time to value

Out of the box Connectors in addition to a flexible Integration Framework simplify the deployment of process automation solutions.

Connectors allow for fast and simple connectivity with multiple applications.

Developers can create custom Connectors which can be used to integrate with custom applications. Anyone using the Modeler can easily find both out-of-the-box and custom Connectors and configure them for use in their business processes.

Ease of integration

The Integration Framework in Camunda allows for simple, low complexity integration with external systems and services.
Business logic outside of Camunda can be easily triggered from a process instance using Service Tasks or Message Throw Events.

Benefits

Time to value

Out of the box Connectors in addition to a flexible Integration Framework simplify the deployment of process automation solutions.

Connectors allow for fast and simple connectivity with multiple applications.

Developers can create custom Connectors which can be used to integrate with custom applications. Anyone using the Modeler can easily find both out-of-the-box and custom Connectors and configure them for use in their business processes.

Ease of integration

The Integration Framework in Camunda allows for simple, low complexity integration with external systems and services.
Business logic outside of Camunda can be easily triggered from a process instance using Service Tasks or Message Throw Events.

Process instances can also be automatically triggered by external systems using Message Catch Events or Receive Tasks.

Benefits

Time to value

Out of the box Connectors in addition to a flexible Integration Framework simplify the deployment of process automation solutions.

Connectors allow for fast and simple connectivity with multiple applications.

Developers can create custom Connectors which can be used to integrate with custom applications. Anyone using the Modeler can easily find both out-of-the-box and custom Connectors and configure them for use in their business processes.

Ease of integration

The Integration Framework in Camunda allows for simple, low complexity integration with external systems and services. Business logic outside of Camunda can be easily triggered from a process instance using Service Tasks or Message Throw Events.

Process instances can also be automatically triggered by external systems using Message Catch Events or Receive Tasks.

Developer friendly

The Connector SDK allows the development of custom Connectors using Java code. Developers can focus on the logic of the Connector, test it locally, and reuse its runtime logic in multiple environments.

Out of the box Connectors

Outbound Inbound Protocol

Outbound Connectors

- Amazon DynamoDB Connector - Interact with Amazon DynamoDB NoSQL database service within your BPMN process, enabling you to store and retrieve data from tables, as well as perform queries and scans.
- Amazon EventBridge Service Connector - Send events using Amazon EventBridge service within your BPMN process.
- Amazon SNS Outbound Connector - Send messages to Amazon Simple Notification Service from your BPMN process.
- Amazon SQS Connector - Send messages to Amazon Simple Queue Service from your BPMN process.
- Asana Connector - Manage Asana projects and tasks from your BPMN process.
- Automation Anywhere Connector - Orchestrate your Automation Anywhere queue from your BPMN process.
- AWS Lambda Connector - Invoke AWS Lambda functions from your BPMN process.
- Blue Prism - Orchestrate your Blue Prism queue items from your BPMN process.
- Camunda Operate Connector - Fetch process execution data from Camunda Operate.
- Easy Post Connector - Create addresses, parcels, and shipments, as well as purchase and verify shipments with EasyPost from your BPMN process.
- Github Connector - Manage GitHub issues and releases from your BPMN process.
- GitLab Connector - Manage GitLab issues and releases from your BPMN process.
- Google Drive Connector - Create folders or files from a Google Drive template from your BPMN process.
- Google Maps Platform Connector - Validate addresses, retrieve postal addresses, and calculate distances with Google Maps Platform Service from your BPMN process.
- Google Sheets Connector - Allows you to work with an existing or new empty spreadsheet on Google Drive from your BPMN process.
- Kafka Producer Connector - Produce messages to Kafka from your BPMN process.
- Microsoft Teams Connector - Interactions with Microsoft Teams from your BPMN process.
- OpenAI Connector - Interact with ChatGPT and OpenAI Moderation API.
- Power Automate Connector - Orchestrate your Power Automate Flows with Camunda.
- RabbitMQ Producer Connector - Send messages to RabbitMQ from your BPMN process.
- Salesforce Connector - Manage your Salesforce instance from your BPMN process.
- SendGrid Connector - Quickly send emails from your BPMN processes.
- Slack outbound Connector - Send messages to channels or users in your Slack workspace from your BPMN process.
- Twilio Connector - Send and get SMS messages with Twilio service from your BPMN process.
- UiPath Connector - Orchestrate your UiPath Bots with Camunda.
- WhatsApp Connector - Send messages with WhatsApp Business from your BPMN process.

Out of the box Connectors

Outbound | Inbound | Protocol

Inbound Connectors

- Amazon EventBridge Webhook Connector - Start a BPMN process instance triggered by an Amazon EventBridge service event.
- Amazon SNS Inbound Connector - Trigger your BPMN process with an Amazon Simple Notification Service notification via HTTPS.
- Amazon SQS Connector - Receive messages from Amazon Simple Queue Service (SQS) in your BPMN process.
- GitHub Webhook Connector - Start a process instance triggered by a GitHub event.
- Kafka Consumer Connector - Consume messages from Kafka from your BPMN process.
- RabbitMQ Consumer Connector - Receive messages from RabbitMQ in your BPMN process.
- Slack Inbound Connector - Trigger a Slack bot to start a BPMN process with an event or a slash command.
- Twilio Webhook Connector - Start a process instance triggered by a Twilio webhook. Can be used as an intermediate connector in existing processes.

Out of the box Connectors

Outbound Inbound Protocol

Protocol Connectors

- GraphQL Connector - Execute a GraphQL query or mutation from your BPMN process.
- HTTP Webhook Connector - Start a process instance with your custom webhook configuration.
- Polling Connector - The HTTP Polling Connector polls an endpoint at regular intervals, enabling periodic data fetching as an intermediate step in your BPMN processes.
- REST Connector - Make a request to a REST API and use the response in the next steps of your process.

Camunda and Slack: Uniting Process Orchestration and Team Collaboration

The Slack Connector is a key asset for any enterprise looking to marry Camunda's robust process orchestration with Slack's dynamic team collaboration. Designed for organizations that value seamless communication within their automated workflows, this Connector enriches business processes with real-time interactions and notifications.

Features and Benefits

Receive Trigger from Slack

Allow Camunda to receive triggers directly from Slack, opening up possibilities for event-driven workflows, real-time decision-making, and user interaction within Slack.

Create a Channel

Enable Camunda-based processes to create new Slack channels automatically. This feature is ideal for project-based collaborations and event-triggered discussions within an enterprise.

Invite to Channel

Facilitate the addition of users to Slack channels directly from within a Camunda-based process, enhancing dynamic team collaboration and focused communication.

Send Message

Enable Camunda to send messages to Slack channels or direct messages. You can use this feature to send automated alerts and updates, or for capturing feedback as part of an orchestrated business process.
