Camunda DMN Decision Table HIT policy Collection

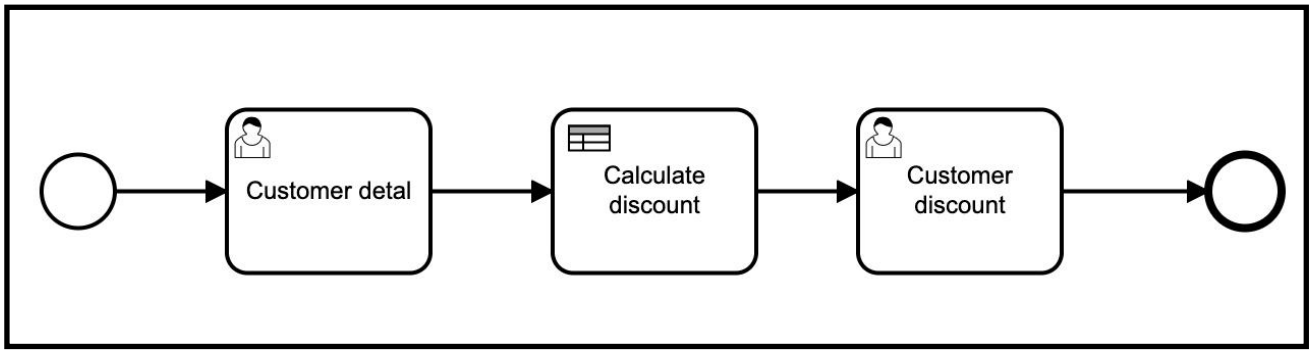
In this session we will try to understand what is decision table with HIT policy Collect

HIT Policy Collect is multiple HIT policy.

COLLECT: Multiple rules can be satisfied. The decision table result contains the output of all satisfied rules in an arbitrary order as a list.

- + (sum): the result of the decision table is the sum of all the distinct outputs.
- < (min): the result of the decision table is the smallest value of all the outputs.
- > (max): the result of the decision table is the largest value of all the outputs.
- # (count): the result of the decision table is the number of distinct outputs.

1. Process definition (BPMN)



2. Decision table (DMN)
